Branch Entry Reduced Forms: Full Period

	(1)	(2)	(3)	(4)	(5)	(6)
Dependent variable	Any failure	Fin restatement	Violation	Any failure	Fin restatement	Violation
Shock coverage	Province	Province	Province	Province + neighbors	Province + neighbors	Province + neighbors
Post-entry average, years 0–5	-0.176051	-0.749347	-0.162344	2.760791**	1.861384**	0.486742
	(0.935443)	(0.752193)	(0.703001)	(1.173438)	(0.675995)	(1.004766)
p	0.8520	0.3271	0.8189	0.0268	0.0108	0.6323
Firms	1,565	1,565	1,565	741	741	741
Two-period pairs	44,422	44,422	44,422	9,649	9,649	9,649
Clusters	31	31	31	26	26	26
Largest client	Excluded	Excluded	Excluded	Excluded	Excluded	Excluded

Notes: Each outcome and spatial-design column is a distinct reduced-form estimate using the existing cohort aggregation. All outcomes are failure indicators interacted with non-MAO. Estimates and standard errors are in percentage points. The original province-cluster (cluster_id=2) output is used. Two-period pair counts are not unique company-year counts. These are not city-level second-stage results.
Standard errors are in parentheses. * $p < 0.10$, ** $p < 0.05$, *** $p < 0.01$.
