*Notes:* Nonfinancial A-shares, 2013–2023. Hh: hth post-announcement June/December endpoint; base: nearest strictly pre-announcement half-year end. Cumulative Y changes are in pp. Separate ES (per 10 pp) and current ROA (per 1 pp) models. Prior financial and analyst controls are listed in the text. Endpoint-quarter FE are nested in industry-year-SOE FE in retained samples. Equal event weights; firm-clustered SE in parentheses. Complete cases and common support; no imputation or winsorization. * $p < 0.10$, ** $p < 0.05$, *** $p < 0.01$, using unrounded $p$-values. Long debt equals long loans plus bonds. Net additions are cumulative balance changes divided by fixed baseline assets. These columns are diagnostics; These are the three ROA interactions with $p < 0.05$ among the 24 small-sample designs. H4/H6 have fewer than 30 events and were not estimated. See the complete workbook for all designs.
